

Line Tension Meters

Water Weights provides a wide range of line tension meters (LTMs) - selected based on rope size - for both non-hazardous and zoned area applications.

LTMs are used on a number of onshore and offshore applications. They can be supplied for permanent or temporary installation and be configured to operate with other measurement devices within the application.

Capable of measuring load, distance (pay in / pay out) and direction and with an optional data logging function, the LTM can be incorporated into systems where multiple lines are required.

Water Weights can supply LTMs either on a rental basis or sold as a single item. We can also provide a service to upgrade existing LTM specification from non-hazardous to hazardous.
