

ET & ES Cabled Series

ET Series Cabled Load Link (5 – 350 Metric Tons)

The ET Series load link provides the same accuracy performance of the LE Series in a cabled version. This model is specifically suited for zoned environments where the transmission of data from a wireless load cell could cause interference with sensitive radio or test equipment, as in military ordinance and radar facilities. The ET Series is also well suited for permanent mounting, where the benefits of having wireless load links cannot be realized or the capacity needed is greater than 250 tons. Requiring no batteries, these make servicing trouble free for hard to reach places.

ES Series Cabled Load Link Shackle (5 – 400 Metric Tons)

For rugged load indication above 200 tons, the ES Series cabled load shackle provides the same benefits of low head height offered in the SL Series but in a cabled package. These units are also suited for zoned environments, as well as permanent mounting for more robust crane monitoring systems. The ES Series, as with all the other cabled load cells, require no batteries for operation, perfect for mounting in locations with limited accessibility.
